

PASS TASK 1

The tasks focused on fundamental web development skills, specifically the creation of an HTML page with various elements, and the application of different types of CSS for styling.

Beginning with the construction of an HTML page, you've successfully included a variety of elements such as an image, a table, a form with multiple input fields, and a heading. In each case, you've ensured to use the appropriate HTML tags and attributes. The form input fields even have a "required" attribute, making them mandatory for form submission.

I have successfully combined inline, internal, and external CSS for styling. While internal CSS was used for generic styles inside a `style` tag in the HTML file, inline CSS was used to style elements like the image and form inputs directly. For additional styles, you also included a link to an external CSS file.

Overall, these assignments have shown that you have a solid grasp of both HTML and CSS and can design a well-structured and attractive web page.
